

Assignment #2 Project Proposal

Application Description

Wikishelf is a Python/Django based web application that allows users to search and browse Wikipedia articles with the help of the Wikipedia API, organize what they find in personal collections. Users can search for any topic, read article summaries, bookmark individual articles, and group their bookmarks in individual collections, for ex: Graphics Programming, Data structures.

UML Diagram

Entities

- User - Someone who registers and uses the platform, owns everything else.
- Collection - A named folder a user creates to group articles.
- Article - A Wikipedia article.
- Tag - A reusable label a user creates.

- ArticleTag - Is the helper entity that records which tags where applied to which articles.
- UserNote - A note a user writes about an article.
- SearchHistory - logs every search query a user runs, so that the app can display recent searches.
- CollectionShare - store the public share token when a user makes a collection public.

Database tables

- Users
- Collections
- Articles
- Tags
- UserNotes
- SearchHistory

Feature List

- User registration, login and logout
- Keyword based article search via Wikipedia API
- View article summary and a link to the full Wikipedia Page
- Bookmark and article (save titles, summary and URL to database)
- Create, rename and delete personal collections
- View all bookmarks

Nice to have

- Add personal notes to bookmark
- Tag bookmarks with custom labels
- Mark collections as public and send share them via URL

- Hosting the application on Vercel

Technologies and Libraries used

Web framework	Django
Database	SQLite
Wikipedia Integration	wikipedia-api
Testing	Pytest
Frontend	Django Templates, Bootstrap
Auth	Django built-in authentication
